

# TAKE A LOOK AT THE TABLE OF CONTENTS

## Part I Basic Concepts of Linear Systems

### 1 Introduction

- 1.1 Control Engineering
- 1.2 A Little History
- 1.3 Impact of the Digital Computer
- 1.4 A First Example: Cruise Control

### 2 Linear Systems Analysis I

- 2.1 Typical First-Order Dynamic Systems
- 2.2 A Brief Review of Complex Numbers
- 2.3 A Brief Review of the Laplace Transform
- 2.4 Time-Domain Response of Typical First-Order Dynamic Systems
- 2.5 Frequency-Domain Properties of Typical First-Order Systems

### 3 Linear Systems Analysis II

- 3.1 Typical Second-Order Dynamic Systems
- 3.2 Transfer Function, Characteristic Equation, and System Poles
- 3.3 Time-Domain Response of Typical Second-Order Dynamic Systems
- 3.4 Characterization of the Underdamped Second-Order Systems
- 3.5 Analysis and Design of a Mass–Damper–Spring System
- 3.6 Analysis and Design of a Simple DC Motor Position Control System
- 3.7 Steady-State Sinusoidal Response & Bode Plot of Typical Second-Order Systems

### 4 Modeling of Mechanical Systems

- 4.1 Translational Mechanical Systems
  - 4.1.1 d'Alembert's Principle
- 4.2 Rotational Mechanical Systems
- 4.3 A Rotational System with a Gear Train
- 4.4 A Simple Inverted Pendulum
- 4.5 Cart-Inverted Pendulum System

### 5 Modeling of Electrical Systems

- 5.1 Basic Electrical Circuit Elements and Circuit Conventions
- 5.2 Basic Time-Domain Circuit Modeling Approaches and Kirchhoff's Laws
- 5.3 Basic Impedance Circuit Modeling Approaches
- 5.4 The Lagrange Approach for Circuit Modeling
- 5.5 Circuit Modeling Using the State-Space Approach
- 5.6 Operational Amplifier Circuits
- 5.7 DC Motor

### 6 Systems Representations and Interconnected Systems

- 6.1 Block Diagrams
- 6.2 Signal Flow Graphs and Mason's Gain Formula
- 6.3 State-Space Model
- 6.4 State Transition Matrix
- 6.5 Solution of the State Equation
- 6.6 State-Space Models and Transfer Functions

## Part II Linear Control System Design

### 7 Fundamentals of Feedback Control Systems

- 7.1 Features of Feedback Control
- 7.2 System Representations and Properties
- 7.3 Stability of Linear Systems
- 7.4 Similarity Transformation in State Space
- 7.5 Pole Placement Control in State Space
- 7.6 Revisit Cart-Inverted Pendulum System
- 7.7 Routh-Hurwitz Stability Criterion

### 8 Stability, Regulation, and Root Locus Design

- 8.1 Type of Feedback Systems and Internal Model Principle
- 8.2 An Automobile Cruise Control Example
- 8.3 Root Locus Preliminaries
- 8.4 Root Locus Analysis and Design
- 8.5 A Sinusoidal Position Tracking Control System
- 8.6 Controller Design for F/A–18 Flight Path Control
- 8.7 Aircraft Altitude Regulation via Flight Path Angle Tracking Control

### 9 Time Delay, Plant Uncertainty, and Robust Stability

- 9.1 Stability Issues Caused by Time Delay and Plant Uncertainty
- 9.2 Contour Mapping and Cauchy's Principle of the Argument
- 9.3 Nyquist Path, Nyquist Plot, and Nyquist Stability Criterion
- 9.4 Robust Stability
- 9.5 Generalized Stability Margins
- 9.6 Essential Closed-Loop Transfer Functions and Loop Shaping

### 10 State Feedback and Linear Quadratic Optimization

- 10.1 Brief Review of the State-Space Approach
- 10.2 Control of a Lightly Damped Positioning System
- 10.3 Controllability
- 10.4 Poles and Zeros of MIMO Systems
- 10.5 State-Feedback Control via Linear Quadratic Regulator Design

### 11 Observer Theory and Output Feedback Control

- 11.1 Observability
- 11.2 Duality in State Space
- 11.3 Minimal Realization and Controllability and Observability
- 11.4 State-Space Models and Minimal Realizations of MIMO Systems
- 11.5 Full-Order Observer and Output Feedback Control
- 11.6 LQG Control Problem and the H2 Control Theory

### A Complex Numbers

- A.1 Definition and Significance of Complex Numbers
- A.2 Complex Number Representations
- A.3 Euler's Formula
- A.4 Algebraic Operations
- A.5 MATLAB Commands for Complex Number Computations

### B Laplace Transforms

- B.1 Definition of Laplace Transform and Laplace Transform Pairs
- B.2 Laplace Transform Properties and More Laplace Transform Pairs
- B.3 Inverse Laplace Transform in the DC Motor Position Control System
- B.4 MATLAB Commands for Laplace Transform Computations

### C Equilibriums and Linearized Models

### D Mason's Gain Formula

### E Vectors and Matrices

- E.1 Vectors and Vector Space
- E.2 Matrices and Linear Operators
- E.3 Linear Algebraic Equations
- E.4 Eigenvalues and Eigenvectors
- E.5 Singular Value Decomposition
- E.6 Positive Definite and Positive Semi-Definite Matrices
